

### **BENZOPYRAN(Benzopirone)**

Benzopyran works synergistically with other medications, aiding their absorption, due to its powerful lymphotropic action. It can significantly reduce edemas of vascular origin.

#### **PHARMACOLOGY**

Benzopyran has a powerful lymphotropic action, promoting a significant reduction of edemas of vascular origin by increasing lymphatic circulation, reducing capillary permeability, and stabilizing plasmatic and lysosome membranes. It reduces the effect of the mediators of the inflammatory process and stimulates the activity of the macrophages and facilitates the elimination of the high molecular weight proteins from the interstitial space by decreasing the osmotic pressure, forcing the liquid back into the cell from the interstitial space.

#### **USES**

Used for the treatment of peripheral vascular insufficiencies, lymphodemas, varices, phlebitis and as coadjuvant in the treatment of cellulite. Used for the prevention of the formation of hematomas or equimosis for people with capillary fragility. In Mesotherapy it is mainly used to improve the absorption of other drugs especially into the lymphatic system.

#### **PACKAGING**

5mg/ml 2ml, Box of 10 vials
