

**BUFLOMEDIL**

**PHARMACOLOGY**

Buflomedil works directly as a vasodilator, and therefore is a phosphodiesterase enzyme inhibitor, which stimulates cyclical AMP and biological vasodilators. It causes peripheral vasodilation, and blocks the calcium channels for vascular smooth muscles. It does not block adrenergic action nor modifies standard hemodynamics. Buflomedil acts directly on the arterial wall, producing a passive vasodilation of the artery, causing an increase in arterial diameter, thus improving irrigation. This medicine is used, with excellent results, in lymphatic drainage or to improve irrigation.

**SIDE EFFECTS**

In rare cases, it can result in low blood pressure. Not to be taken while breast feeding, or people with hemorrhagic diathesis.

**USAGE**

In Mesotherapy it is used for cellulite, circulation, stretch marks, alopecia and pain. It is also commonly used for treating impotency.

**PACKAGING**

1% / - 2ml, Box of 10 vials
