

MESOGLYCANS(Mesoglicano)

Mesoglycan is a type of substance found in many tissues in the body, including the joints, intestines, and the lining of blood vessels. Chemically, mesoglycan is related to the blood-thinning drug heparin and the supplement chondroitin. Mesoglycan is not an essential nutrient because the body usually manufactures it from scratch. For supplement purposes, mesoglycan is commercially extracted from the intestines of pigs. Very similar substances can be produced from cartilage, bone, and the lining of large blood vessels, and are often used interchangeably. There have been studies that have found mesoglycan to be effective in treating inflammation, AIDS and cancer.

USAGE

In Mesotherapy, mesoglycan is used for facial rejuvenation, and to treat cellulite in difficult areas.

PACKAGING

30mg / ml – 1ml – Box of 10 vials
